

RL in Text Generation

Question

Julie is reading a 120-page book. She read 12 pages yesterday and twice that today. If she plans to read half of what's left tomorrow, how many pages will she read?

Reasoning Process

Julie read $12 \times 2 = 24$ pages today.

Step I

Step II

Step III

Step IV

So she was able to read a total of $12 + 24 = 36$ pages since yesterday.

There are $120 - 36 = 84$ pages left to be read.

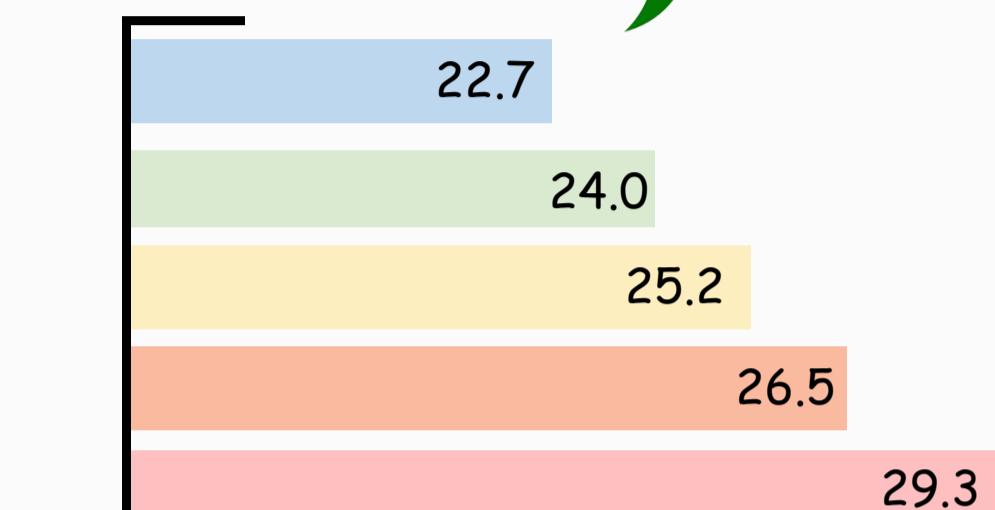

Since she wants to read half of the remaining pages tomorrow, then she should read $\frac{84}{2} = 42$ pages.

Answer

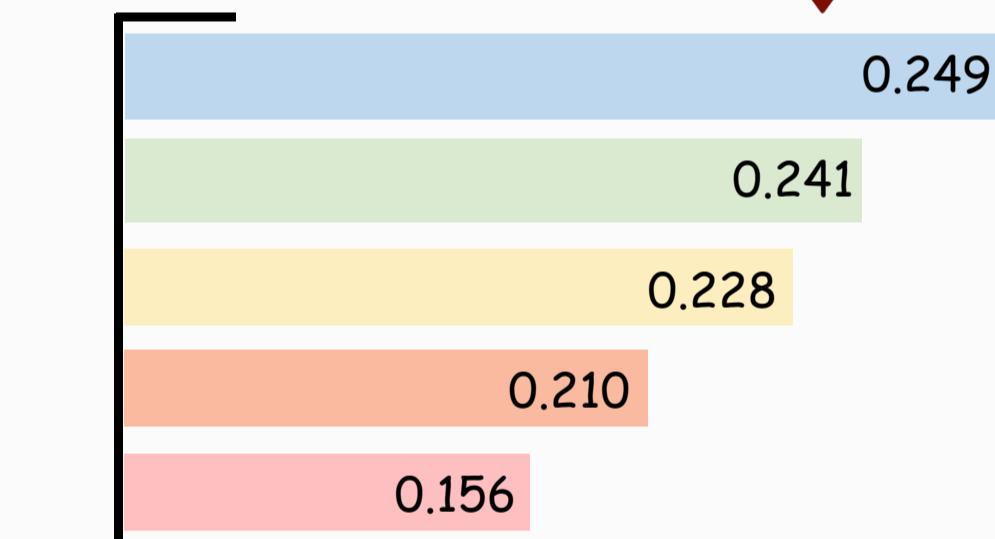

42
